

ZEROth REVIEW - PROJECT PHASE I

Explainable AI-Based **Personal Financial Copilot**

Predictive Budgeting, Goal Forecasting, and Financial Risk Analysis

Introduction & Motivation

Why do we need an AI Financial Copilot?

The Problem with Current Applications

Basic Tracking

Most applications only record past transactions and generate simple retrospective reports, completely lacking proactive financial planning.

Black-Box AI

Users receive automated predictions without understanding why they were generated, significantly reducing trust in AI-based financial systems.

Weak Forecasting

Existing systems offer limited financial risk analysis and struggle to provide accurate, personalized long-term financial goal forecasting.

Proposed Solution

- An AI-powered Copilot that moves beyond traditional budgeting to offer **proactive decision support**.
- **Predictive Budgeting:** Analyzes historical spending patterns using ML to accurately forecast future budgets.
- **Explainable AI (XAI):** Transparently explains the reasoning behind every prediction and recommendation to build user trust.
- **Conversational UX:** Allows users to interact naturally with their data for personalized, on-demand financial guidance.

600 × 400

Project Objectives

1. Core AI Development

Develop an intelligent personal financial management system that leverages machine learning techniques to predict future budgets and forecast goal achievement based on specific user spending behaviors.

2. Trust & Transparency

Analyze financial risks such as overspending and integrate Explainable AI (XAI) frameworks. The primary goal is to improve transparency, user trust, and financial literacy through a conversational interface.

Scope & Target Audience

600 × 400

Empowering Diverse Demographics

The proposed system is intended for **students, salaried employees, freelancers, and families** who wish to fundamentally improve their financial planning and decision-making.

The core scope includes comprehensive expense management, predictive budgeting, goal forecasting, and interactive conversational support driven by Explainable AI.

Expected Contributions

XAI Framework

Introducing an Explainable AI framework specifically designed for transparent, understandable financial recommendations.

Decision Support

Delivering improved financial decision support through highly personalized recommendations and holistic risk analysis.

Conversational UX

Deploying a conversational AI assistant that allows for natural, interactive, and accessible financial guidance.

Future Scope

Open Banking APIs

Seamless integration for real-time, automated transaction fetching.

Voice-Based Assistants

Enabling hands-free financial queries, inputs, and accessibility.

Blockchain Technology

Implementing decentralized ledgers for highly secure financial records.

Federated Learning

Privacy-preserving AI training models built directly on decentralized user data.
